## PREDICTION RESULT

### Pancreatic Cancer

| Metric | Value |
|---|---|
| Cancer Probability | 82.73% |
| Confidence | 82.73% |
| Risk Level | High |

## TUMOR ANALYSIS

| Parameter | Value |
|---|---|
| Tumor Area | 1.83 cm² |
| Estimated Volume | 0.46 cc |
| Location | Pancreatic Body |
| Stage Suggestion | Possible Stage I-II (T1-T2) — Localized tumor |
| Inference Time | 73.521 seconds |
| GPU Status | CPU Only |

## EVALUATION METRICS

| Metric | Score |
|---|---|
| Dice Coefficient (DSC) | 1.0000 |
| Intersection over Union (IoU) | 1.0000 |
| Hausdorff Distance 95% (HD95) | 0.0000 |
| Precision | 1.0000 |
| Recall | 1.0000 |
| F1 Score | 1.0000 |
| Sensitivity | 1.0000 |

| | |
|---|---|
| Specificity | 1.0000 |
| Accuracy | 1.0000 |
| Avg. Surface Distance (ASD) | 0.0000 |
| Volume Similarity (VS) | 1.0000 |

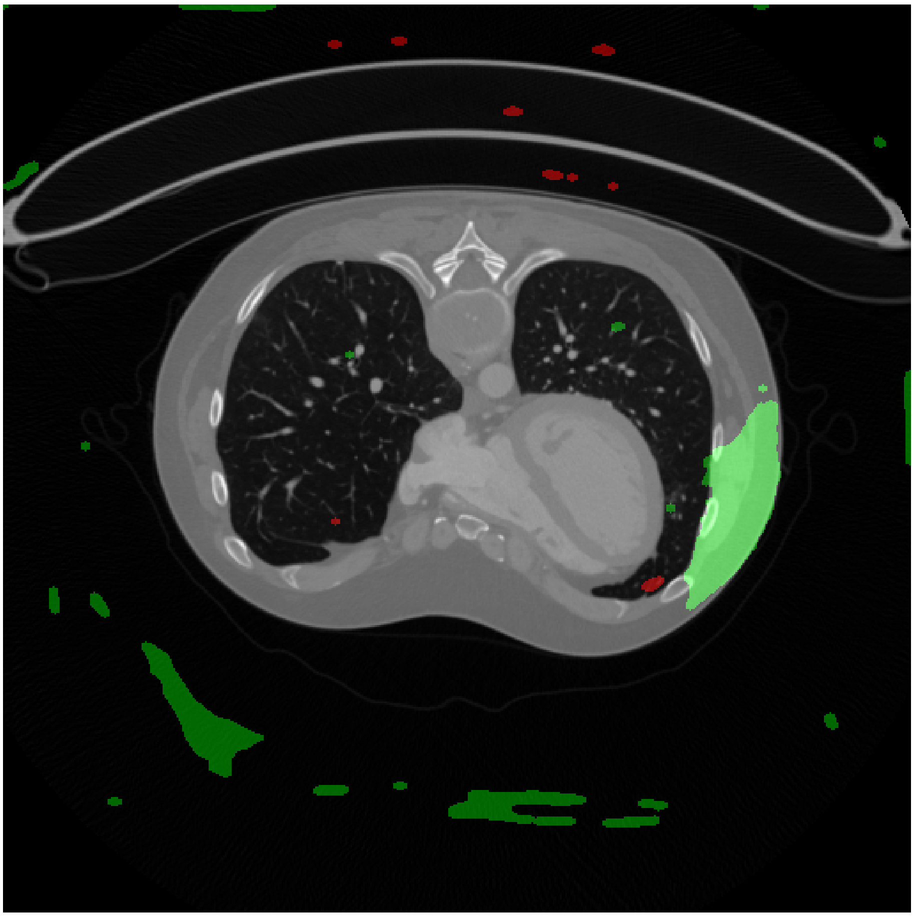
### Segmentation Overlay



## CLINICAL SUMMARY

AI-ASSISTED ANALYSIS SUMMARY

The deep learning model has identified findings consistent with pancreatic malignancy with a confidence of 82.73%. The detected lesion is located in the Pancreatic Body region, with an estimated area of 1.83 $cm^2$ and an approximate volume of 0.46 cc.

STAGING: Possible Stage I-II (T1-T2) — Localized tumor

RISK ASSESSMENT: High

The segmentation analysis reveals a focal lesion that warrants further clinical evaluation. The Grad-CAM attention map highlights the regions most influential in the model's decision.

RECOMMENDATION: Correlation with clinical history, laboratory markers (CA 19-9), and contrast-enhanced CT/MRI is strongly recommended. Referral to a hepatopancreatobiliary specialist is advised for further workup.

## PHYSICIAN NOTES
