AI-Assisted Pancreatic Cancer Analysis Report

PancreasAI Research Lab

Patient ID:	E6AD9FF0-E43	**Date:**	2026-07-14
Analysis ID:	e6ad9ff0	**Time:**	20:15:47
Report Type:	AI-Assisted Screening	**Mode:**	Demo

PREDICTION RESULT

Pancreatic Cancer

Metric	Value
Cancer Probability	96.43%
Confidence	98.1%
Risk Level	Very High

TUMOR ANALYSIS

Parameter	Value
Tumor Area	10.7 cm²
Estimated Volume	2.68 cc
Location	Pancreatic Body
Stage Suggestion	Possible Stage II-III (T2-T3) — Moderate tumor
Inference Time	0.256 seconds
GPU Status	CPU Only

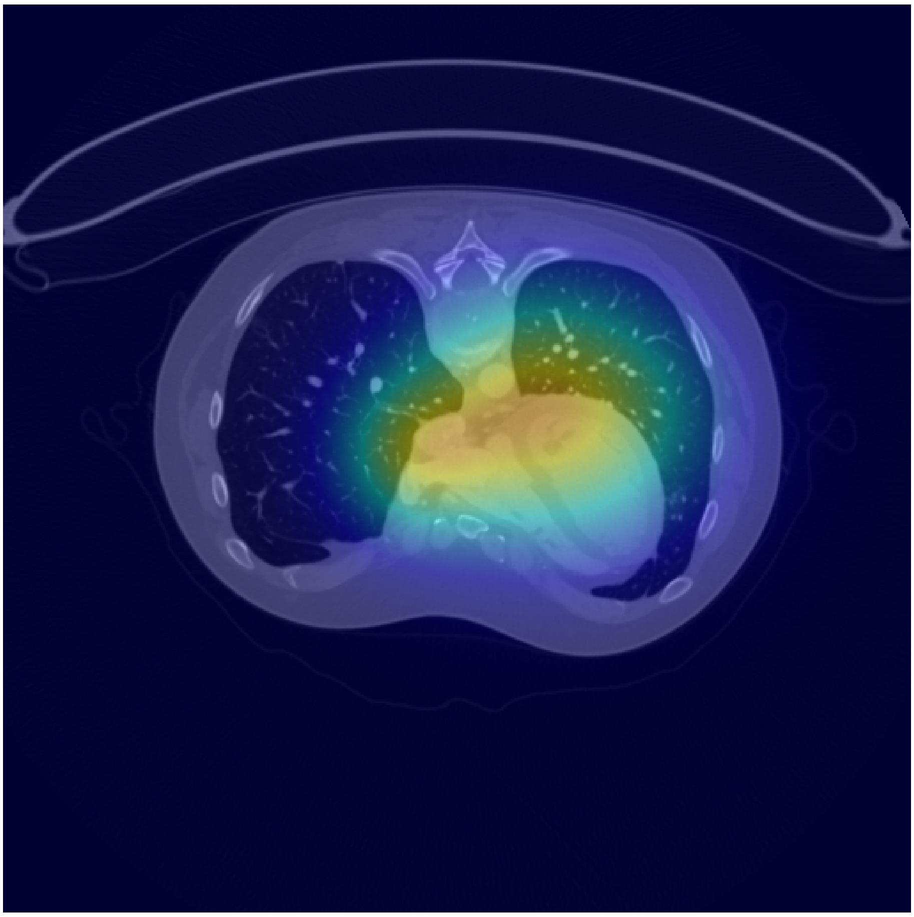
EVALUATION METRICS

Metric	Score
Dice Coefficient (DSC)	0.9910
Intersection over Union (IoU)	0.9821
Hausdorff Distance 95% (HD95)	1.0000
Precision	0.9821
Recall	1.0000
F1 Score	0.9910
Sensitivity	1.0000

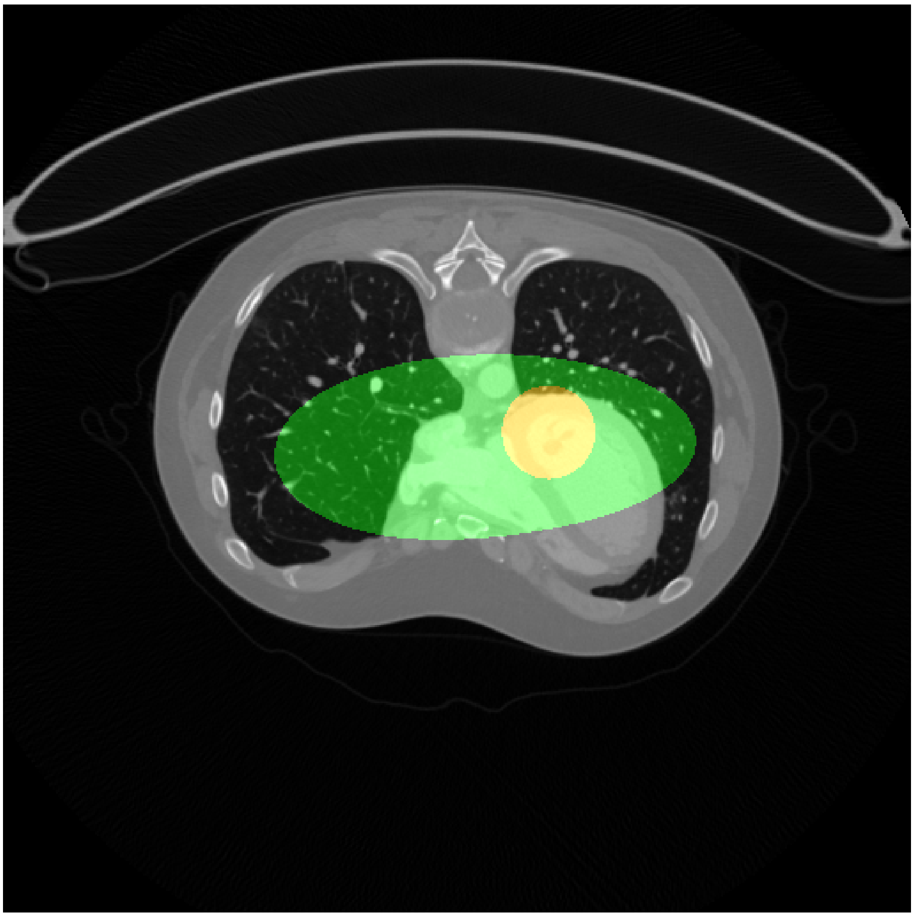
Specificity	0.9998
Accuracy	0.9999
Avg. Surface Distance (ASD)	0.1327
Volume Similarity (VS)	0.9910

VISUALIZATION

Grad-CAM Heatmap



Segmentation Overlay



CLINICAL SUMMARY

AI-ASSISTED ANALYSIS SUMMARY

The deep learning model has identified findings consistent with pancreatic malignancy with a confidence of 98.1%. The detected lesion is located in the Pancreatic Body region, with an estimated area of 10.7 cm^2 and an approximate volume of 2.68 cc.

STAGING: Possible Stage II-III (T2-T3) — Moderate tumor

RISK ASSESSMENT: Very High

The segmentation analysis reveals a focal lesion that warrants further clinical evaluation. The Grad-CAM attention map highlights the regions most influential in the model's decision.

RECOMMENDATION: Correlation with clinical history, laboratory markers (CA 19-9), and contrast-enhanced CT/MRI is strongly recommended. Referral to a hepatopancreatobiliary specialist is advised for further workup.

PHYSICIAN NOTES

DISCLAIMER: This report was generated by an AI system for research and educational purposes only. It is NOT a certified medical diagnosis. All findings must be reviewed and validated by a qualified healthcare professional before any clinical decisions are made.
